ePayment API

INFORMATION GATEWAY

A DOCUMENT ON API INTEGRATION / TEST

PRESENTED BY: SRL

API MECHANISM

The gateway will receive information in GET method parameterized as: ‘org_code’, ‘org_br_code’, ‘acc_num’,’ billcycle’, `pc_code’, ’pc_br_code’, ‘channel_type, ‘customer_code’ & ‘password’. The ePayment API must cross check whether it was valid or invalid to prevent fraud. Then ePayment API will send regarding information to the Bank.

As a good programming practice, as well as to keep things simple, your script should GET parameters from ePayment API and dispatch it immediately to another routine or process that handles the logic associated with the message. If your script is structured in this way, it will receive a message against a query and dispatch it for processing by your application logic.

The script must:

1. Create a request that contains exactly the same variables and values in the same order.
2. Wait for a response from ePayment API, which is either VALID or INVALID REQUEST.
3. If the response is Valid, perform the following checks:
   - Confirm your system that the task status is completed. ePayment API sends messages for pending and denied tasks as well;
   - Verify that the information and so on, check provides additional protection against fraud.
4. If the verified response passes the checks, take action based on the verification; otherwise, do not shift or deliver the information.
5. If the response is INVALID, save the customer ID for further investigation. There might be some fraudulent activity involved.

Below goes SAMPLE CODE for INFORMATION REQUEST

STEP 1: Data Request to SRL

Name : Organization Name
Parameter : org_code
Description : Name of the Organization.
Type : Alphanumeric String
Length 4
Requirement : Mandatory

Name : Organization Branch Name
Parameter : org_br_code
Description : The branch name of the organization.
Type : Alphanumeric String
Length :
Requirement : As Per Discussion

Name : Consumer Number
Parameter : acc_num
Description : Organization Consumer Number
Type : Numeric String
Length :
Requirement : Mandatory

Name : Bill Month Name
Parameter : billcycle
Description : Requested Bill Month.
Type : Numeric String
Length 6
Requirement : Mandatory

Name : Pay Collector Name
Parameter : pc_code
Description : Consumer Bank Name.
Type : Numeric String
Length :
Requirement : Mandatory

Name : Pay Collector Branch Name
Parameter : pc_br_code
Description : Consumer Bank Branch Name.
Type : Numeric String
Length :
Requirement : Mandatory

Name : Channel Type
Parameter : channel_type
Description : Specific User Name is given from SRL to Merchant.
Type : Alphanumeric String
Length :
Requirement : Mandatory

Name : Customer Code
Parameter : customer_code
Description : Specific Customer Code is given from SRL to Merchant.
Type : Alphanumeric String
Length :
Requirement : Mandatory

Name : Password
Parameter : password
Description : Specific Password is given from SRL to Merchant.
Type : Alphanumeric String
Length :
Requirement : Mandatory

Sample Request:

```
<?php

$org_code=urlencode("BPDB");
$org_br_code= urlencode("");
$acc_num=urlencode("47137125");
$billcycle=urlencode("202102");
$pc_code= urlencode("01");
$pc_br_code= urlencode("100");
$channel_type= urlencode("1");
$customer_code= urlencode("Dbbl@Test");
$password= urlencode("Dbbl@Test1234");

$requested_url
=("http://118.67.219.193/epay_dbbl/Payment_Gateway.php?org_code=".$org_code."&org_br_code=".$
org_br_code."&acc_num=".$acc_num."&billcycle=".$billcycle."&pc_code=".$pc_code."&pc_br_code=".
$pc_br_code."&customer_code=".$customer_code."&password=".$password."&channel_type=".$chan
nel_type."&v=1&format=json");

$handle = curl_init();
curl_setopt($handle, CURLOPT_URL, $requested_url);
curl_setopt($handle, CURLOPT_RETURNTRANSFER, true);
curl_setopt($handle, CURLOPT_SSL_VERIFYHOST, false);
curl_setopt($handle, CURLOPT_SSL_VERIFYPEER, false);
curl_setopt($handle, CURLOPT_POST, true);
curl_setopt($handle, CURLOPT_CUSTOMREQUEST, "POST");
$result = curl_exec($handle);
$code = curl_getinfo($handle, CURLINFO_HTTP_CODE);
if($code == 200 && !( curl_errno($handle))){
print $result;
}
else
        {
echo $result;
exit;
}

?>
```

After JSON Decode the format comes like following:

Sample Output:

{"COMPANY_CODE":"BPDB","NAME":"MANAGER PUBALI BANK","ACCOUNT_NUMBER":"47342923","BILL_MONTH":"202102","BILL_NUMBER":"9194956048","PRINCIPLE_AMOUNT":"9913","COMMISION_AMT":"0","VAT_AMOUNT":"496","ORG_ACCOUNT":"H6","PRINCIPLE_ACC_NUM":"123456789456","VAT_ACC_NUM":"100987655","REV_STAMP_AMOUNT":"0","PC_CODE":"01","TOTAL_AMT":10409,"REQ_ID":"MBP10000000057962"}

Name	Description
COMPANY_ CODE	BPDB
NAME	MANAGER PUBALI BANK
ACCOUNT_ NUMBER	47342923
BILL_MONTH	202102
BILL_NUMBER	9194956048
PRINCIPLE_AMOUNT	9913
COMMISION_AMT	0
VAT_AMOUNT	496
ORG_ACCOUNT	H6
PRINCIPLE_ACC_NUM	123456789456
VAT_ACC_NUM	100987655
REV_STAMP_AMOUNT	0
PC_CODE	01
TOTAL_AMT	10409
REQ_ID	MBP10000000057962

STEP 2: Transaction Confirmation

Name : Consumer Number
Parameter : acc_num
Description : Organization Consumer Number
Type : Numeric String
Length :
Requirement : Mandatory

Name : Pay Collector Name
Parameter : pc_code
Description : Consumer Bank Name.
Type : Numeric String
Length :
Requirement : Mandatory

Name : Transaction ID
Parameter : trns_id
Description : Transaction Identification Number.
Type : Numeric String
Length :
Requirement : Mandatory

Name : Request ID
Parameter : req_id
Description : Request Identification for Transaction.
Type : Alphanumeric String
Length :
Requirement : Mandatory

Name : Customer Code
Parameter : customer_code
Description : Specific Customer Code is given from SRL to Merchant.
Type : Alphanumeric String
Length :
Requirement : Mandatory

Name : Password
Parameter : password
Description : Specific Password is given from SRL to Merchant.
Type : Alphanumeric String
Length :
Requirement : Mandatory

Name : Channel Type
Parameter : channel_type
Description : For over the counter payment set parameter 1 otherwise 0.
Type : Alphanumeric String
Length 1
Requirement : Mandatory Field

Name : Pay Date
Parameter : pay_date
Description : Date of payment has been made.
Type : Date String
Length :
Requirement : As per Discussion

Sample Request:

```
<?php
$acc_num=urlencode("47137125");
$pc_code= urlencode("01");//Given By SRL
$trns_id= urlencode("bgtyyyyy");
$req_id= urlencode("MBP10000000057961");
$customer_code= urlencode("Dbbl@Test");// Given By SRL
$password= urlencode("Dbbl@Test1234");//Given By SRL
$channel_type= urlencode("1"); // Given By SRL
$pay_date= urlencode("28/03/2021");//Given By SRL

$requested_url
=("http://118.67.219.193/epay_dbbl/Payment_Gateway.php?acc_num=".$acc_num."&customer_code=".$cust
omer_code."&pc_code=".$pc_code."&password=".$password."&trns_id=".$trns_id."&req_id=".$req_id."&pay_
date=".$pay_date."&channel_type=".$channel_type."&v=1&format=json");

$handle = curl_init();
curl_setopt($handle, CURLOPT_URL, $requested_url);
curl_setopt($handle, CURLOPT_RETURNTRANSFER, true);
curl_setopt($handle, CURLOPT_SSL_VERIFYHOST, false);
curl_setopt($handle, CURLOPT_SSL_VERIFYPEER, false);
curl_setopt($handle, CURLOPT_POST, true);
curl_setopt($handle, CURLOPT_CUSTOMREQUEST, "POST");
$result = curl_exec($handle);
$code = curl_getinfo($handle, CURLINFO_HTTP_CODE);
if($code == 200 && !( curl_errno($handle))){
print $result;
}
else
{
echo $result;
exit;
}
?>
```

After JSON Decode the format comes like following:

SAMPLE OUTPUT:

```
{

"code":"400","msg":"Success!!!"

}
```

Name	Description
Code	400
msg	Success

STEP 3: Transaction Status Check

Name : Organization Name
Parameter : org_code
Description : Name of the Organization.
Type : Alphanumeric String
Length 4
Requirement : Mandatory

Name : Consumer Number
Parameter : acc_num
Description : Organization Consumer Number
Type : Numeric String
Length :
Requirement : Mandatory

Name : Request ID
Parameter : req_id
Description : Request Identification for Transaction.
Type : Alphanumeric String
Length :
Requirement : Mandatory

Sample Request:

```
<?php

$org_code= urlencode("BPDB");
$acc_num= urlencode("32470938");
$req_id= urlencode("MBP10000000058007");

$requested_url =("http://118.67.219.193/epay_dbbl/status_check.php");
$param = "org_code=".$org_code."&acc_num=".$acc_num."&req_id=".$req_id."&v=1&format=json";

$handle = curl_init();
curl_setopt($handle, CURLOPT_URL, $requested_url);
curl_setopt($handle,CURLOPT_SSL_VERIFYHOST,false);
curl_setopt($handle,CURLOPT_SSL_VERIFYPEER,false);
curl_setopt($handle,CURLOPT_CUSTOMREQUEST,'POST');
curl_setopt($handle,CURLOPT_POSTFIELDS,$param);
curl_setopt($handle,CURLOPT_RETURNTRANSFER,true);
curl_setopt($handle,CURLOPT_FOLLOWLOCATION,true);
$result = curl_exec($handle);
print $result;
curl_close($handle);
return $result;

?>
```

After JSON Decode the format comes like following:

SAMPLE OUTPUT:

```
{

{"CODE":"411","MSG":"Already
Paid","ACC_NUM":"32470938","BILL_MONTH":"202108","TOT_AMT":"4495","PRIN_AMT":"4281","V
AT":"214","PAY_DATE":"15-SEP-21","BANK_TRAN_ID":"6334382963"}
}
```

Channel Type List:

Channel Type	Description
1	Mobile Financial System
2	Over The Counter
3	Agent Banking
4	Nexus Card, Visa Card
5	Internet Banking

Error Code:

Message	Code
Data Not Found	448
Success	400
Bill Already Paid	411
User Name Mismatch	444
One or multiple Mandatory parameters are missing	410
Data Mismatch	412
Not Permitted for this action	409
Due Date Over	465
Invalid Request Id	421
Internal Server Error	420
Invalid Date Format	480
